.

Merge Sort

Write a Python program to sort a list of elements using the merge sort algorithm.

For example:

| Input | Result |
|----------------|-----------|
| 5 6 5 4 3 8 | 3 4 5 6 8 |

Program:

```
a=int(input())
l=[]
l.extend(input().split())
for i in range(a-1):
    for j in range(a-1):
        if(int(l[j])>int(l[j+1])):
        t=int(l[j])
        l[j]=int(l[j+1])
        l[j+1]=t
for i in range(a):
    print(int(l[i]),end=" ")
```

| | Input | Expected | Got |
|---|---------------------------------|----------------------------|------------------------|
| ~ | 5 6 5 4 3 8 | 3 4 5 6 8 | 3 4 5 6 8 |
| ~ | 9 14 46 43 27 57 41 45 21 70 | 14 21 27 41 43 45 46 57 70 | 14 21 27 41 43 45 46 5 |
| ~ | 4 86 43 23 49 | 23 43 49 86 | 23 43 49 86 |

Passed all tests! 🗸

Correct

Marks for this submission: 1.00/1.00.

.

Bubble Sort

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1 Last Element: 6

Input Format

The first line contains an integer,n, the size of the <u>list</u> a. The second line contains n, space-separated integers a[i].

Constraints

- · 2<=n<=600
- \cdot 1<=a[i]<=2x10⁶.

Output Format

You must print the following three lines of output:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

Sample Input 0

3

123

Sample Output 0

<u>List</u> is sorted in 0 swaps.

First Element: 1
Last Element: 3

For example:

| Input | Result |
|------------|---|
| 3 3 2 1 | List is sorted in 3 swaps. First Element: 1 Last Element: 3 |
| 5 19284 | List is sorted in 4 swaps. First Element: 1 Last Element: 9 |

Program:

```
def bubble_sort(arr):
  n = len(arr)
  swaps = 0
  for i in range(n):
    for j in range(0, n-i-1):
        if arr[j] > arr[j + 1]:
          # Swap elements
          arr[j], arr[j + 1] = arr[j + 1], arr[j]
          swaps += 1
  return swaps
# Input the size of the list
n = int(input())
# Input the list of integers
arr = list(map(int, input().split()))
# Perform bubble sort and count the number of swaps
num_swaps = bubble_sort(arr)
```

```
# Print the number of swaps
print("List is sorted in", num_swaps, "swaps.")
# Print the first element
print("First Element:", arr[0])
# Print the last element
print("Last Element:", arr[-1])
```

| List is sorted in 3 swaps. List is sorted in 3 swaps. First Element: 1 First Element: 1 |
|---|
| Last Element: 3 Last Element: 3 |
| List is sorted in 4 swaps. List is sorted in 4 swaps. First Element: 1 Last Element: 9 List is sorted in 4 swaps. First Element: 1 Last Element: 9 |

٠

Peak Element

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

 $A[i-1] \le A[i] \ge a[i+1]$ for middle elements. $[0 \le i \le n-1]$

 $A[i-1] \le A[i]$ for last element [i=n-1]

A[i] >= A[i+1] for first element [i=0]

Input Format

The first line contains a single integer n, the length of A. The second line contains n space-separated integers, A[i].

Output Format

Print peak numbers separated by space.

Sample Input

5

891026

Sample Output

106

For example:

| Input | Result |
|---------------|--------|
| 4 12 3 6 8 | 12 8 |

Program:

def find_peak(arr):

peak_elements = []

```
# Check for the first element
  if arr[0] >= arr[1]:
    peak_elements.append(arr[0])
  # Check for middle elements
  for i in range(1, len(arr) - 1):
    if arr[i - 1] \le arr[i] \ge arr[i + 1]:
       peak_elements.append(arr[i])
  # Check for the last element
  if arr[-1] >= arr[-2]:
    peak_elements.append(arr[-1])
  return peak_elements
# Input the length of the list
n = int(input())
# Input the list of integers
arr = list(map(int, input().split()))
# Find peak elements and print the result
peak_elements = find_peak(arr)
print(*peak_elements)
```

.

Binary Search

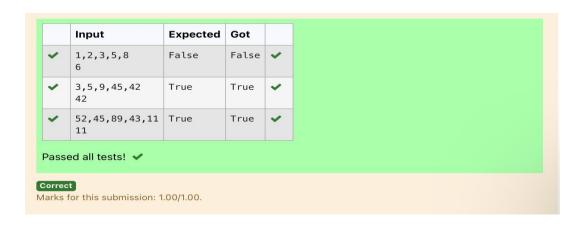

Write a Python program for binary search.

For example:

| Input | Result |
|-------------------|--------|
| 12358 | False |
| 3 5 9 45 42 42 | True |

Program:

a = input().split(",")
b = input()
print(b in a)

٠

Frequency of Elements

To find the frequency of numbers in a list and display in sorted order.

Constraints:

1<=n, arr[i]<=100

Input:

1 68 79 4 90 68 1 4 5

output:

1 2

4 2

5 1

68 2

79 1

90 1

For example:

| Input | Result |
|-------------|-------------------|
| 4 3 5 3 4 5 | 3 2 4 2 5 2 |

Program:

def count_frequency(arr):

frequency = {}

Count the frequency of each number in the list for num in arr:

```
frequency[num] = frequency.get(num, 0) + 1

# Sort the dictionary based on keys
sorted_frequency = sorted(frequency.items())

# Print the frequency of each number
for num, freq in sorted_frequency:
    print(num, freq)

# Input the list of numbers
arr = list(map(int, input().split()))

# Count the frequency and print the result
count_frequency(arr)
```
